BAB 2 PEMBEZAAN / Chapter 2 : Differentiation

2.1 Had dan Hubungannya dengan Pembezaan

2.1 *Limit and Its Relation to Differentiation*

- ❖ Had merupakan konsep asas dalam operasi pembezaan seperti halaju, v suatu objek pada masa t yang disebut sebagai halaju seketika
- ❖ *The concept of limits has been regarded as a basic concept in differential operations, just like the concept of velocity, v of an object at a certain time t is regarded as its instantaneous velocity at that moment.*

| -0.1 | 2.9 |

| -0.0001 | 2.9999 |
| 0 | 3 |
| 0.0001 | 3.0001 |
| 0.001 | 3.001 |
| 0.01 | 3.01 |
| 0.1 | 3.1 |

$$\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{x^2 + 3x}{x} = 3$$

When x approaches a , where $x \neq a$, the limit for $f(x)$ is L can be written as

$$\lim_{x \rightarrow a} f(x) = L.$$

To find the limit value of a function $f(x)$, we substitute $x = a$ directly into the function $f(x)$. If,

$$f(a) \neq \frac{0}{0}$$

The value of $\lim_{x \rightarrow a} f(x)$ can be obtained, that is, $\lim_{x \rightarrow a} f(x) = f(a)$.

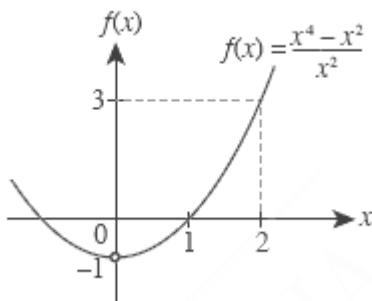

$$f(a) = \frac{0}{0}$$

Determine $\lim_{x \rightarrow a} f(x)$ by using the following methods:

- Factorisation
- Rationalising the numerator or denominator of the function.

The diagram on the right shows a part of the graph $f(x) = \frac{x^4 - x^2}{x^2}$, $x \neq 0$. Based on the graph, find

- a) $f(0)$ b) $\lim_{x \rightarrow 0} f(x)$ c) $\lim_{x \rightarrow 2} f(x)$

Penyelesaian :

Solution :

- a) There is no value for $x = 0$. Therefore, $f(0)$ cannot be defined at $x = 0$.
- b) When $x \rightarrow 0$ either from the left or from the right, $f(x) \rightarrow -1$. Thus, $\lim_{x \rightarrow 0} f(x) = -1$.
- c) When $x \rightarrow 2$ either from the left or from the right, $f(x) \rightarrow 3$. Thus, $\lim_{x \rightarrow 2} f(x) = 3$.

2.1.2 Terbitan Pertama suatu fungsi $f(x)$ melalui pembezaan dengan Prinsip Pertama
2.1.2 First Derivative of a function $f(x)$ by using first principles

Tangen kepada suatu lengkung di suatu titik ialah satu garis lurus yang menyentuh lengkung pada titik itu. Dalam rajah di sebelah, garis lurus AT dengan koordinat A dan T masing-masing ialah $(2, 4)$ dan $(3, 8)$ ialah tangen kepada lengkung $y = x^2$ di titik A .

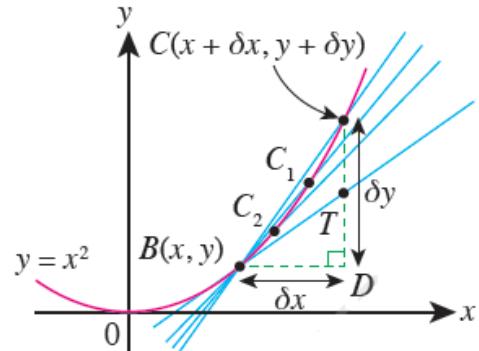

A tangent to a curve at a point is a straight line that touches the curve at only that point. In the diagram on the right, straight line AT is a tangent to the curve $y = x^2$ at the point A with the coordinates of A and T being $(2, 4)$ and $(3, 8)$ respectively.

$$\text{Gradient of tangent } AT = \frac{y_2 - y_1}{x_2 - x_1} = \frac{8 - 4}{3 - 2} = 4$$

$$\begin{aligned}\text{Gradient of the line } BC &= \frac{CD}{BD} \\ &= \frac{(y + \delta y) - y}{(x + \delta x) - x} \\ &= \frac{\delta y}{\delta x}\end{aligned}$$

$$\begin{aligned}\text{Gradient of the curve at } B &= \text{Gradient of tangent } BT \\ &= \text{Value of } \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x}\end{aligned}$$

$$\frac{dy}{dx} = \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} = \lim_{\delta x \rightarrow 0} \frac{f(x + \delta x) - f(x)}{\delta x}$$

$$y = f(x) = x^2$$

Penyelesaian :

Solution :

$$\begin{aligned}\delta y &= f(x + \delta x) - f(x) \\ &= (x + \delta x)^2 - x^2 \\ &= x^2 + 2x(\delta x) + (\delta x)^2 - x^2 \\ &= 2x(\delta x) + (\delta x)^2 \\ \frac{\delta y}{\delta x} &= \frac{2x(\delta x) + (\delta x)^2}{\delta x} \\ &= 2x + \delta x\end{aligned}$$

$$\begin{aligned}\frac{dy}{dx} &= \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} \\ &= \lim_{\delta x \rightarrow 0} (2x + \delta x) \\ &= 2x + 0 \\ \frac{dy}{dx} &= 2x\end{aligned}$$

Terbitan pertama bagi suatu fungsi $y = f(x)$ dengan menggunakan idea had $\frac{\delta y}{\delta x \rightarrow 0}$ seperti ini disebut sebagai **PEMBEZAAN DENGAN PRINSIP PERTAMA**.

Contoh 1 :

Example 1 :

$$y = 3x$$

Penyelesaian :

Solution :

$$\begin{aligned}\delta y &= f(x + \delta x) - f(x) \\ &= 3(x + \delta x) - 3x \\ &= 3x + 3\delta x - 3x \\ &= 3\delta x\end{aligned}$$

$$\frac{\delta y}{\delta x} = 3$$

Then,

$$\begin{aligned}\frac{dy}{dx} &= \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} \\ &= \lim_{\delta x \rightarrow 0} 3\end{aligned}$$

$$\frac{dy}{dx} = 3$$

Contoh 2 :

Example 2 :

$$y = 3x^2$$

Penyelesaian :

Solution :

$$\begin{aligned}\delta y &= f(x + \delta x) - f(x) \\ &= 3(x + \delta x)^2 - 3x^2 \\ &= 3[x^2 + 2x(\delta x) + (\delta x)^2] - 3x^2 \\ &= 3x^2 + 6x(\delta x) + 3(\delta x)^2 - 3x^2 \\ &= 6x(\delta x) + 3(\delta x)^2\end{aligned}$$

$$\frac{\delta y}{\delta x} = 6x + 3\delta x$$

Then,

$$\begin{aligned}\frac{dy}{dx} &= \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} \\ &= \lim_{\delta x \rightarrow 0} (6x + 3\delta x) \\ &= 6x + 3(0)\end{aligned}$$

$$\frac{dy}{dx} = 6x$$

Contoh 3 :

Example 3 :

$$y = 3x^3$$

Penyelesaian :

Solution :

$$\begin{aligned}\delta y &= f(x + \delta x) - f(x) \\ &= 3(x + \delta x)^3 - 3x^3 \\ &= 3(x + \delta x)(x + \delta x)^2 - 3x^3 \\ &= 3(x + \delta x)[x^2 + 2x(\delta x) + (\delta x)^2] - 3x^3 \\ &= 3[x^3 + 2x^2(\delta x) + x(\delta x)^2 + x^2(\delta x) + 2x(\delta x)^2 + (\delta x)^3] - 3x^3 \\ &= 3[x^3 + 3x^2(\delta x) + 3x(\delta x)^2 + (\delta x)^3] - 3x^3 \\ &= 3x^3 + 9x^2(\delta x) + 9x(\delta x)^2 + 3(\delta x)^3 - 3x^3 \\ &= 9x^2(\delta x) + 9x(\delta x)^2 + 3(\delta x)^3\end{aligned}$$

$$\frac{\delta y}{\delta x} = 9x^2 + 9x(\delta x) + 3(\delta x)^2$$

Then,

$$\begin{aligned}\frac{dy}{dx} &= \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} \\ &= \lim_{\delta x \rightarrow 0} [9x^2 + 9x(\delta x) + 3(\delta x)^2] \\ &= 9x^2 + 9x(0) + 3(0)^2\end{aligned}$$

$$\frac{dy}{dx} = 9x^2$$

Then, $\frac{du}{dx} = 6x - 4$ and $\frac{dy}{du} = 7u^6$

With chain rule,

$$\begin{aligned}\frac{dy}{dx} &= \frac{dy}{du} \times \frac{du}{dx} \\ &= 7u^6(6x - 4) \\ &= 7(3x^2 - 4x)^6(6x - 4) \\ &= (42x - 28)(3x^2 - 4x)^6 \\ \frac{dy}{dx} &= 14(3x - 2)(3x^2 - 4x)^6\end{aligned}$$

With chain rule,

$$\begin{aligned}\frac{dy}{dx} &= \frac{dy}{du} \times \frac{du}{dx} \\ &= -\frac{3}{u^4}(2) \\ \frac{dy}{dx} &= -\frac{6}{(2x + 3)^4}\end{aligned}$$

(c) Let $u = 6x^2 + 8$ and $y = \sqrt{u} = u^{\frac{1}{2}}$

With chain rule,

$$\begin{aligned}\frac{dy}{dx} &= \frac{dy}{du} \times \frac{du}{dx} \\ &= \frac{1}{2\sqrt{u}}(12x) \\ &= \frac{12x}{2\sqrt{6x^2 + 8}} \\ \frac{dy}{dx} &= \frac{6x}{\sqrt{6x^2 + 8}}\end{aligned}$$

First Derivative of a function involving product and quotient of algebra expressions

The Product Rule

If u and v are functions of x , then

$$\frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$$

The Quotient Rule

If u and v are functions of x , and $v(x) \neq 0$, then

$$\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$$

Contoh :

Example :

1. Bezakan setiap yang berikut terhadap x .

Differentiate each of the following with respect to x .

a) $(x^2 + 1)(x - 3)^4$

b) $(3x + 2)\sqrt{4x - 1}$

Penyelesaian :

Solution :

(a) Given $y = (x^2 + 1)(x - 3)^4$.

Let $u = x^2 + 1$

and $v = (x - 3)^4$

We get $\frac{du}{dx} = 2x$

and $\frac{dv}{dx} = 4(x - 3)^{4-1} \frac{d}{dx}(x - 3)$
 $= 4(x - 3)^3$

Hence, $\frac{dy}{dx} = u \frac{dv}{dx} + v \frac{du}{dx}$
 $= (x^2 + 1) \times 4(x - 3)^3 + (x - 3)^4 \times 2x$
 $= 4(x^2 + 1)(x - 3)^3 + 2x(x - 3)^4$
 $= 2(x - 3)^3[2(x^2 + 1) + x(x - 3)]$
 $\frac{dy}{dx} = 2(x - 3)^3(3x^2 - 3x + 2)$

Penyelesaian :

Solution :

(b) Given $y = (3x + 2)\sqrt{4x - 1}$.

Let $u = 3x + 2$

and $v = \sqrt{4x - 1} = (4x - 1)^{\frac{1}{2}}$

We get $\frac{du}{dx} = 3$

and $\frac{dv}{dx} = \frac{1}{2}(4x - 1)^{\frac{1}{2}-1} \frac{d}{dx}(4x - 1)$
 $= \frac{1}{2}(4x - 1)^{-\frac{1}{2}}(4)$
 $= \frac{2}{\sqrt{4x - 1}}$

Hence, $\frac{dy}{dx} = u \frac{dv}{dx} + v \frac{du}{dx}$
 $= (3x + 2) \times \frac{2}{\sqrt{4x - 1}} + \sqrt{4x - 1} \times 3$
 $= \frac{2(3x + 2)}{\sqrt{4x - 1}} + 3\sqrt{4x - 1}$
 $= \frac{2(3x + 2) + 3(4x - 1)}{\sqrt{4x - 1}}$

$$\frac{dy}{dx} = \frac{18x + 1}{\sqrt{4x - 1}}$$

2.4.3 Menyelesaikan masalah yang melibatkan tangen dan normal

Solving problems involving tangent and normal

Contoh:**Example:**

Rajah di sebelah menunjukkan sebatang jalan raya yang boleh diwakili oleh lengkung

$y = \frac{1}{2}x^2 - 2x + 2$. Kumar memandu keretanya di jalan raya itu. Oleh kerana hujan, jalan tersebut menjadi licin dan menyebabkan Kumar tersasar di titik A lalu mengikut laluan AB yang merupakan garis tangen $y = 2x - c$ kepada jalan raya itu. Cari

The diagram on the right shows a road which is represented by the curve $y = \frac{1}{2}x^2 - 2x + 2$. Kumar drove on the road. As it was raining and the road was slippery, his car skidded at A and followed the line AB, which is tangent to the road at A and has an equation of $y = 2x - c$. Find

(a) koordinat A

the coordinates of A.

(b) nilai pemalar c.

the value of constant c.

Penyelesaian:**Solution:**

(a) $y = \frac{1}{2}x^2 - 2x + 2$

$$\frac{dy}{dx} = x - 2$$

Oleh sebab $y = 2x - c$ ialah tangen kepada jalan raya $y = \frac{1}{2}x^2 - 2x + 2$ di titik A, jadi

$$\frac{dy}{dx} = 2$$

$$x - 2 = 2$$

$$x = 2$$

Oleh sebab titik A terletak di atas lengkung, jadi

$$y = \frac{1}{2}(4)^2 - 2(4) + 2$$

$$y = 2$$

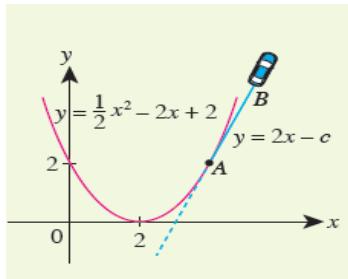

Maka, koordinat A ialah (4,2)

(b) Titik A (4,2) terletak di atas laluan AB, iaitu $y = 2x - c$, jadi

$$2 = 2(4) - c$$

$$c = 6$$

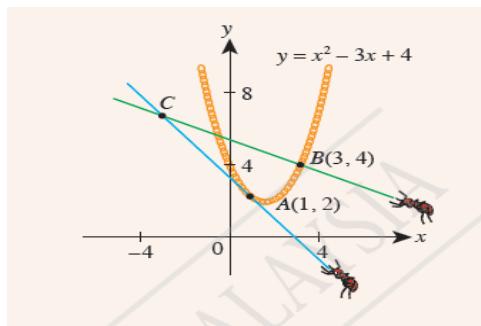

Maka, nilai bagi pemalar c ialah 6.

Jawapan/Answer: [(a) $3\sqrt{10}$ unit (b) $h = \frac{1}{2}, k = -2$]

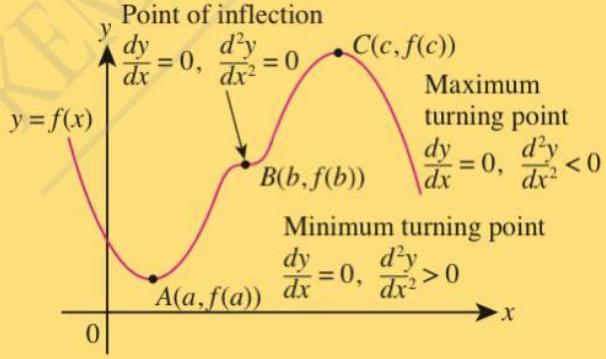

2.4.4 Titik pusingan dan sifat titik pusingan tersebut

Turning points and their nature

Titik pegun bagi lengkung $y = f(x)$

Stationary points of curve $y = f(x)$

Contoh:**Example:**

Diberi lengkung $y = x^3 - 3x^2 - 9x + 11$.

Given the curve $y = x^3 - 3x^2 - 9x + 11$.

(a) Cari koordinat titik pusingan bagi lengkung itu.

Find the coordinates of the turning points of the curve.

(b) Tentukan sama ada setiap titik pusingan itu ialah titik maksimum atau minimum.

Determine whether each of the turning points is a maximum or minimum point.

Penyelesaian:**Solution:**

$$(a) y = x^3 - 3x^2 - 9x + 11$$

$$\frac{dy}{dx} = 3x^2 - 6x - 9 = 3(x^2 - 2x - 3)$$

$$\frac{dy}{dx} = 3(x+1)(x-3)$$

Untuk titik pusingan, $\frac{dy}{dx} = 0$

$$x = -1 \text{ atau } x = 3$$

$$\text{Apabila } x = -1, y = (-1)^3 - 3(-1)^2 - 9(-1) + 11$$

$$y = 16$$

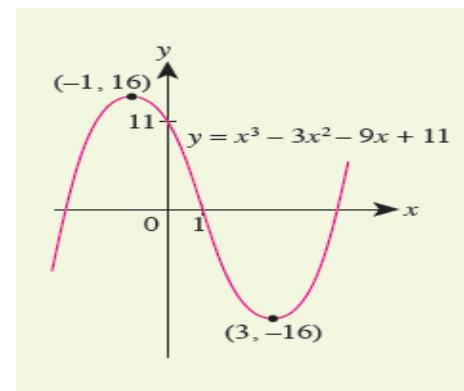

$$\text{Apabila } x = 3, y = (3)^3 - 3(3)^2 - 9(3) + 11$$

$$y = -16$$

Maka, titik pusingan ialah $(-1, 16)$ dan $(3, -16)$.

(b)

| x | -1.5 | -1 | -0.5 | 2.5 | 3 | 3.5 |
|----------------------------|------|----|-------|-------|---|------|
| $\frac{dy}{dx}$ | 6.75 | 0 | -5.25 | -5.25 | 0 | 6.75 |
| Tanda bagi $\frac{dy}{dx}$ | + | 0 | - | - | 0 | + |
| Lakaran tangen | / | - | \ | \ | - | / |
| Lakaran graf | | | | | | |

Daripada jadual, tanda bagi $\frac{dy}{dx}$ berubah daripada positif kepada negatif apabila x menokok melalui $x = -1$ dan tanda bagi $\frac{dy}{dx}$ berubah daripada negatif kepada positif apabila x menokok melalui $x = 3$. Maka, titik pusingan $(-1, 16)$ ialah titik maksimum dan titik pusingan $(3, -16)$ ialah titik minimum.

Contoh:**Example:**

Cari titik-titik pegun bagi lengkung lengkung $y = 2x^3 + 3x^2 - 12x + 5$ dan tentukan sifat setiap titik pegun itu .

Find the stationary points for each of the following curves and determine the nature of each stationary point

Penyelesaian:**Solution:**

$$y = 2x^3 + 3x^2 - 12x + 5$$

$$\frac{dy}{dx} = 6x^2 + 6x - 12 = 6(x^2 + x - 2)$$

$$\frac{dy}{dx} = 6(x + 2)(x - 1)$$

$$\text{Untuk titik pusingan, } \frac{dy}{dx} = 0$$

$$x = -2 \text{ atau } x = 1$$

$$\text{Apabila } x = -2, y = 2(-2)^3 + 3(-2)^2 - 12(-2) + 5$$

$$y = 25$$

$$\text{Apabila } x = 1, y = 2(1)^3 + 3(1)^2 - 12(1) + 5$$

$$y = -2$$

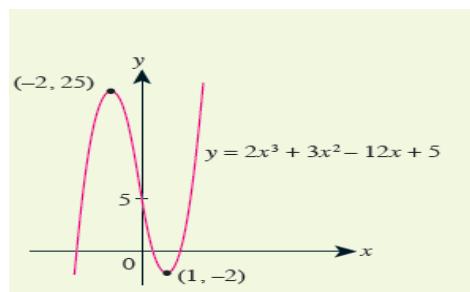

Maka, titik pusingan ialah $(-2, 25)$ dan $(1, -2)$.

$$\frac{d^2y}{dx^2} = 12x + 6$$

$$\text{Apabila } x = -2, \frac{d^2y}{dx^2} = 12(-2) + 6 = -18 < 0$$

$$\text{Apabila } x = 1, \frac{d^2y}{dx^2} = 12(1) + 6 = 18 > 0$$

Maka, $(-2, 25)$ ialah titik maksimum dan $(1, -2)$ ialah titik minimum.

2.4.5 Menyelesaikan masalah yang melibatkan nilai maksimum dan nilai minimum serta mentafsir penyelesaian tersebut
Solving problems involving maximum and minimum values and interpreting the solutions

Contoh:

Example:

Sebuah kilang ingin menghasilkan tin makanan berbentuk silinder yang diperbuat daripada beberapa kepingan aluminium dengan isi padu 512 cm^3 . Permukaan melengkung tin dibentuk dengan menggulung sekeping aluminium berbentuk segi empat tepat manakala bahagian atas dan bawah tin dibentuk dengan memotong keluar dua buah bulatan daripada dua keping aluminium berbentuk segi empat sama. Cari jejari tapak tin itu, dalam cm , supaya jumlah luas permukaan semua kepingan aluminium yang digunakan adalah minimum.

A factory wants to produce cylindrical tins from aluminium sheets to contain food. Each tin has a volume of 512 cm^3 . The curved surface is made by rolling a rectangular piece of aluminium while the top and bottom are circular pieces cut out from two aluminium squares. Find the radius of the tin, in cm , such that the total surface of the aluminium sheets used will be minimum.

Penyelesaian:

Solution:

Isi padu tin, $\ell = 512$

Jumlah luas permukaan, $L \text{ cm}^2$, kepingan-kepingan aluminium yang digunakan diberi oleh

$$L = 8j^2 + 2\pi jt \dots \dots \dots \quad (2)$$

Gantikan (1) ke dalam (2)

$$L = 8j^2 + 2\pi j \left(\frac{512}{\pi j^2} \right)$$

$$L = 8j^2 + \frac{1024}{j}$$

$$\frac{dL}{dj} = 16j - \frac{1024}{j^2}$$

Untuk nilai minimum, $\frac{dL}{di} = 0$

$$16j - \frac{1024}{j^2} = 0$$

$$16j^3 - 1024 = 0$$

$$j^3 = \frac{106}{16}$$

$$j^3 \equiv 64$$

j = 4

$$\frac{dL}{dj} = 16j - 1024j^{-2}$$

$$\frac{d^2L}{d j^2} = 16 + \frac{2048}{j^3}$$

$$\text{Apabila } j = 4, \quad \frac{d^2L}{dj^2} = 16 + \frac{2048}{4^3} = 48 > 0$$

Maka, L mempunyai nilai minimum apabila jejari tapak ialah 4cm .

2.4.6 Mentafsir dan menentukan kadar perubahan bagi kuantiti yang terhubung Interpreting and determining rates of change for related quantities

Kadar perubahan yang terhubung

Jika dua pemboleh ubah yang terhubung x dan y berubah dengan masa, t , maka

$$\frac{dy}{dt} = \frac{dy}{dx} \times \frac{dx}{dt}$$

Rates of change of related quantities

If two variables, x and y change with time, t , then

$$\frac{dy}{dt} = \frac{dy}{dx} \times \frac{dx}{dt}$$

Contoh:

Example:

Suatu lengkung mempunyai persamaan $y = x^2 + \frac{4}{x}$. Cari

A curve has an equation $y = x^2 + \frac{4}{x}$. Find

- (a) ungkapan bagi $\frac{dy}{dx}$
an expression for $\frac{dy}{dx}$

- (b) kadar perubahan y apabila $x = 1$ dan $x = 2$, diberi bahawa x menokok dengan kadar tetap 3 unit per saat.

the rate of change of y when $x = 1$ and $x = 2$, given that x increases at a constant rate of 3 units per second.

Penyelesaian:

Solution:

$$(a) y = x^2 + \frac{4}{x} = x^2 + 4x^{-1}$$

$$\frac{dy}{dx} = 2x - 4x^{-2} = 2x - \frac{4}{x^2}$$

$$(b) \text{ Apabila } x = 1, \frac{dy}{dx} = 2(1) - \frac{4}{1^2} = -2$$

Kadar perubahan y diberi oleh :

$$\begin{aligned}\frac{dy}{dt} &= \frac{dy}{dx} \times \frac{dx}{dt} \\ &= -2 \times 3 \\ &= -6\end{aligned}$$

Jadi, kadar perubahan dalam y ialah -6 unit per saat. Maka, y dikatakan menyusut pada kadar 6 unit per saat.

$$\text{Apabila } x = 2, \frac{dy}{dx} = 2(2) - \frac{4}{2^2} = 3$$

Kadar perubahan y diberi oleh :

$$\begin{aligned}\frac{dy}{dt} &= \frac{dy}{dx} \times \frac{dx}{dt} \\ &= 3 \times 3 \\ &= 9\end{aligned}$$

Jadi, kadar perubahan dalam y ialah 9 unit per saat. Maka, y dikatakan menokok pada kadar 9 unit per saat.

Rajah di sebelah menunjukkan sebuah bekas berisi air yang berbentuk kon dengan jejari 5 cm dan tinggi 12 cm . Didapati bahawa air tersebut mengalir keluar melalui lubang kecil di hujung bekas dengan kadar tetap $4 \text{ cm}^3 \text{s}^{-1}$. Find the rate of change of the depth of water in the cone when the height of water is 3 cm , correct to four significant figures.

Penyelesaian:

Solution:

Katakan $r \text{ cm}$, $h \text{ cm}$ dan $V \text{ cm}^3$ masing-masing ialah jejari, tinggi dan isi padu air di dalam bekas itu pada masa t saat.

$$V = \frac{1}{3}\pi\left(\frac{5h}{12}\right)^2 h$$

$$V = \frac{1}{3}\pi\left(\frac{25h^3}{144}\right)$$

$$V = \frac{25\pi}{432} h^3$$

Kadar perubahan V diberi oleh petua rantai berikut.

$$\begin{aligned}\frac{dV}{dt} &= \frac{dV}{dh} \times \frac{dh}{dt} \\ &= \frac{d}{dh} \left(\frac{25\pi}{432} h^3 \right) \times \frac{dh}{dt} \\ \frac{dV}{dt} &= \frac{25\pi}{144} h^2 \times \frac{dh}{dt}\end{aligned}$$

Apabila $h = 3$ dan $\frac{dV}{dt} = -4$, kita peroleh

$$-4 = \frac{25\pi}{144}(3)^2 \times \frac{dh}{dt}$$

$$-4 = \frac{25\pi}{16} \times \frac{dh}{dt}$$

$$\frac{dh}{dt} = -\frac{64}{25\pi}$$

0.8149

Maka, kadar perubahan kedalaman air di dalam bekas itu ialah -0.8148cms^{-1} dan kedalaman air dikatakan menyusut pada kadar 0.8148cms^{-1}

Contoh:

Jejari sebiji belon berbentuk sfera yang diisikan dengan udara bertambah pada kadar tetap 0.5 cm per saat. Cari kadar perubahan isi padu belon itu apabila jejariinya ialah 4 cm , betul kepada empat angka bererti.

The radius of a spherical balloon filled with air increases at a rate of 0.5 cm per second. Find the rate of change of its volume when the radius is 4 cm , correct to four significant figures.

Penyelesaian:**Solution:**

Andaikan $l = f(j)$

Kadar perubahan l diberi oleh:

$$\frac{dl}{dt} = \frac{dl}{dj} \times \frac{dj}{dt}$$

Diketahui bahawa $l = \frac{4}{3}\pi j^3$

$$\text{Jadi, } \frac{dl}{dt} = \frac{d}{dj} \left(\frac{4}{3}\pi j^3 \right) \times \frac{dj}{dt}$$

$$\frac{dl}{dt} = 4\pi j^2 \times \frac{dj}{dt}$$

Apabila $j = 4$ dan $\frac{dj}{dt} = 0.5$, maka

$$\frac{dl}{dt} = 4\pi(4)^2 \times 0.5$$

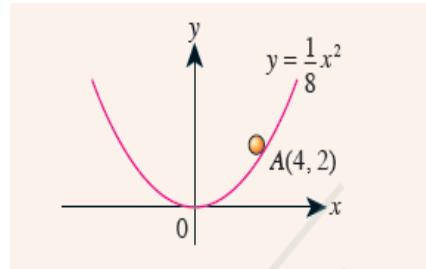

$$\frac{dl}{dt} = 4\pi(16) \times 0.5 = 32(3.142) = 100.5$$

Maka, kadar perubahan isi padu belon apabila $j = 4 \text{ cm}$ ialah 100.5 cm^3 per saat.

2.4.8 Mentafsir dan menentukan perubahan kecil dan penghampiran suatu kuantiti Interpreting and determining small changes and approximations of certain quantities

Perubahan kecil dan penghampiran
Jika $y = f(x)$ dan perubahan kecil dalam x , iaitu δx menyebabkan perubahan kecil dalam y , iaitu δy , maka

$$\begin{aligned}\frac{\delta y}{\delta x} &\approx \frac{dy}{dx} \\ \delta y &\approx \frac{dy}{dx} \times \delta x \\ \text{dan } f(x + \delta x) &\approx y + \delta y \\ &\approx y + \frac{dy}{dx}(\delta x)\end{aligned}$$

Small changes and approximations
If $y = f(x)$ and the small change in x , that is δx , causes a small change in y , that is δy , then

$$\begin{aligned}\frac{\delta y}{\delta x} &\approx \frac{dy}{dx} \\ \delta y &\approx \frac{dy}{dx} \times \delta x \\ \text{and } f(x + \delta x) &\approx y + \delta y \\ &\approx y + \frac{dy}{dx}(\delta x)\end{aligned}$$

Contoh:

Example:

Diberi bahawa $y = x^3$, cari

- (a) perubahan hamper dalam y jika x menokok daripada 4 kepada 4.05
(b) perubahan hamper dalam x jika y menyusut daripada 8 kepada 7.97

Penyelesaian:

Solution:

(a) $y = x^3$

$$\frac{dy}{dx} = 3x^2$$

Apabila $x = 4$, $\delta x = 4.05 - 4 = 0.05$ dan

$$\frac{dy}{dx} = 3(4)^2 = 48$$

Jadi, $\delta y \approx \frac{dy}{dx} \times \delta x = 48 \times 0.05$

$$\delta y = 2.4$$

Maka, perubahan hamper dalam y , iaitu

δy ialah 2.4

$\delta y > 0$ bermaksud berlakunya tokokan kecil dalam y sebanyak 2.4

(b) Apabila $y = 8$, $x^3 = 8$, $x = 2$

$$\delta y = 7.97 - 8 = -0.03 \text{ dan}$$

$$\frac{dy}{dx} = 3(2)^2 = 12$$

Jadi, $\delta y \approx \frac{dy}{dx} \times \delta x$

$$-0.03 = 12 \times \delta x$$

$$\delta x = \frac{-0.03}{12}$$

$$\delta x = -0.0025$$

Maka, perubahan hamper dalam x , iaitu

δx ialah -0.0025

$\delta x < 0$ bermaksud berlakunya susutan kecil dalam x sebanyak 0.0025

Contoh:**Example:**

Diberi bahawa $y = \sqrt{x}$, cari

(a) nilai $\frac{dy}{dx}$ apabila $x = 4$

(b) nilai hampir bagi $\sqrt{4.02}$

Penyelesaian:**Solution:**

$$(a) y = \sqrt{x} = x^{\frac{1}{2}}$$

$$\frac{dy}{dx} = \frac{1}{2}x^{\frac{1}{2}-1} = \frac{1}{2}x^{-\frac{1}{2}} = \frac{1}{2\sqrt{x}}$$

$$\text{Apabila } x = 4, \quad \frac{dy}{dx} = \frac{1}{2\sqrt{4}} = \frac{1}{2(2)} = \frac{1}{4}$$

$$(b) \text{ Apabila } x = 4, y = \sqrt{4} = 2$$

$$\delta x = 4.02 - 4 = 0.02 \text{ dan } \frac{dy}{dx} = \frac{1}{4}$$

Menggunakan $f(x + \delta x) \approx y + \frac{dy}{dx}\delta x$

$$\sqrt{4 + 0.02} = 2 + \frac{1}{4}(0.02)$$

$$\sqrt{4.02} = 2.005$$

Maka, nilai hamper bagi $\sqrt{4.02}$ ialah 2.005

Contoh:**Example:**

Diberi $y = 2x^2 - 3x + 4$. Apabila $x = 2$, terdapat perubahan kecil dalam x sebanyak 3%. Dengan menggunakan konsep kalkulus, cari peratus perubahan dalam y yang sepadan.

Penyelesaian:**Solution:**

$$\text{Diberi } y = 2x^2 - 3x + 4$$

$$\text{Apabila } x = 2, y = 2(2)^2 - 3(2) + 4 = 6$$

$$\frac{dy}{dx} = 4x - 3 = 4(2) - 3 = 5 \text{ dan } \delta x = \frac{3}{100} \times 2 = 0.06$$

$$\text{Jadi, } \delta y = \frac{dy}{dx} \times \delta x = 5 \times 0.06 = 0.3$$

$$\frac{\delta y}{y} \times 100 = \frac{0.3}{6} \times 100 = 5$$

Maka, peratus perubahan dalam y yang sepadan ialah 5%

2.4.9 Menyelesaikan masalah yang melibatkan perubahan kecil dan penghampiran suatu kuantiti Solving problems involving small changes and approximations of certain quantities

Contoh:

Example:

Cari perubahan kecil dalam isi padu, $I \text{ cm}^3$, sebiji bola kaca yang berbentuk sfera apabila jejarianya, $j \text{ cm}$, bertambah daripada 3 cm kepada 3.02 cm .

Penyelesaian:

Solution:

Katakan $I \text{ cm}^3$ dan $j \text{ cm}$ masing-masing ialah isi padu dan jejari bola kaca itu.

$$\text{Jadi } I = \frac{4}{3}\pi j^3$$

$$\frac{dl}{dj} = 4\pi j^2$$

$$\text{Apabila } j = 3, \delta j = 3.02 - 3 = 0.02 \text{ dan } \frac{dl}{dj} = 4\pi(3)^2 = 36\pi$$

$$\text{Oleh itu, } \delta l = \frac{dl}{dj} \times \delta j = 36\pi \times 0.02$$

$$\delta l = 2.262$$

Maka, perubahan kecil dalam isi padu bola kaca itu ialah 2.262 cm^3

BAB 3 PENGAMIRAN CHAPTER 3 INTEGRATION

3.1 Pengamiran sebagai Songsangan Pembezaan Integration as the Inverse of Differentiation

3.1.1 Perkaitan antara pembezaan dengan pengamiran The relation between differentiation and integration

NOTA / NOTE :

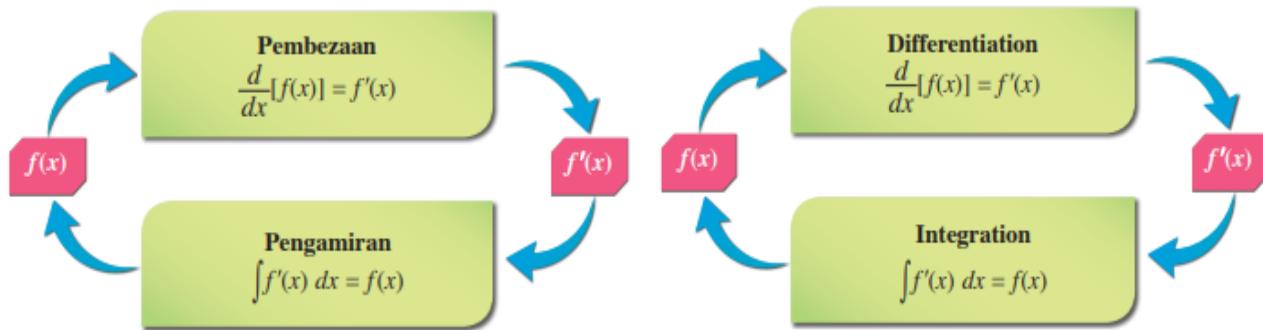

1. Pengamiran ialah suatu proses songsangan bagi pembezaan.

Integration is in fact the reverse process of differentiation.

2. Jika y ialah satu fungsi x atau $y = f(x)$ dan $\frac{dy}{dx} = f'(x)$, maka $\int \frac{dy}{dx} dx = y + c$ atau $\int f'(x) dx = y + c$, dengan c = pemalar.

If y is a function of x or $y = f(x)$ and $\frac{dy}{dx} = f'(x)$, then $\int \frac{dy}{dx} dx = y + c$ or $\int f'(x) dx = y + c$, such that c = constant.

3.

4.

Jika $\frac{d}{dx}[f(x)] = f'(x)$, maka kamiran bagi $f'(x)$ terhadap x ialah $\int f'(x) dx = f(x)$.

If $\frac{d}{dx}[f(x)] = f'(x)$, then the integral of $f'(x)$ with respect to x is $\int f'(x) dx = f(x)$.

5. Imbas Kembali / Recall :

- (a) Jika $y = ax^n$, maka $\frac{dy}{dx} = anx^{n-1}$. / (a) If $y = ax^n$, then $\frac{dy}{dx} = anx^{n-1}$.
- (b) Jika $y = a$, maka $\frac{dy}{dx} = 0$. / (b) If $y = a$, then $\frac{dy}{dx} = 0$

Contoh 1:**Contoh 1**

Diberi $\frac{d}{dx}(4x^2) = 8x$, cari $\int 8x \, dx$.

Penyelesaian

Pembezaan bagi $4x^2$ ialah $8x$.

Secara songsangan, pengamiran bagi $8x$ ialah $4x^2$.

Oleh itu, $\int 8x \, dx = 4x^2$.

Example 1:**Example 1**

Given $\frac{d}{dx}(4x^2) = 8x$, find $\int 8x \, dx$.

Solution

Differentiation of $4x^2$ is $8x$.

By the reverse of differentiation, the integration of $8x$ is $4x^2$.

Hence, $\int 8x \, dx = 4x^2$.

Contoh 2:**Contoh 2**

Penghasilan arang batu di sebuah kawasan perlombongan diberi oleh $K = 48000t - 100t^3$, dengan keadaan K ialah jisim arang batu yang dihasilkan, dalam tan, dan t ialah masa, dalam tahun.

- Cari kadar penghasilan arang batu, $\frac{dK}{dt}$, dalam sebutan t .
- Jika kadar penghasilan arang batu berubah kepada $\frac{dK}{dt} = 96000 - 600t^2$, hitung jisim arang batu yang dihasilkan, dalam tan, pada tahun ke-4.

**Penyelesaian**

- Diberi $K = 48000t - 100t^3$.

$$\text{Maka, } \frac{dK}{dt} = 48000 - 300t^2.$$

- Diberi $\frac{dK}{dt} = 96000 - 600t^2$
 $= 2(48000 - 300t^2)$

Secara songsangan, pengamiran bagi $48000 - 300t^2$ ialah $48000t - 100t^3$.

$$\begin{aligned} \text{Oleh itu, } \int 2(48000 - 300t^2) \, dt &= 2(48000t - 100t^3) \\ &= 96000t - 200t^3 \end{aligned}$$

$$\begin{aligned} \text{Maka, jisim arang batu yang dihasilkan pada tahun ke-4} &= 96000(4) - 200(4)^3 \\ &= 371200 \text{ tan} \end{aligned}$$

Example 2:**Example 2**

The coal production from a coal mine is given by $K = 48000t - 100t^3$, where K is the mass of coal produced, in tonnes, and t is the time, in years.

- Find the rate of production of coal, $\frac{dK}{dt}$, in terms of t .
- If the rate of production of coal is given by $\frac{dK}{dt} = 96000 - 600t^2$, find the mass of coal produced, in tonnes, in the fourth year.

**Solution**

(a) Given $K = 48000t - 100t^3$.

Then, $\frac{dK}{dt} = 48000 - 300t^2$.

(b) Given $\frac{dK}{dt} = 96000 - 600t^2$
 $= 2(48000 - 300t^2)$

By the reverse of differentiation, the integration of $48000 - 300t^2$ is $48000t - 100t^3$.

Hence, $\int 2(48000 - 300t^2) dt = 2(48000t - 100t^3)$
 $= 96000t - 200t^3$

Therefore, the mass of coal produced in the fourth year $= 96000(4) - 200(4)^3$
 $= 371200$ tonnes

3.2.3 Kamiran tak tentu bagi fungsi berbentuk $(ax+b)^n$, dengan keadaan a dan b ialah pemalar, n ialah integer dan $n \neq -1$

Indefinite integral for functions in the form of $(ax+b)^n$, where a and b are constants, n is an integer and $n \neq -1$

NOTA / NOTE :

Terbitan rumus kamiran tak tentu bagi fungsi berbentuk $(ax+b)^n$, dengan keadaan a dan b ialah pemalar, n ialah integer dan $n \neq -1$:

Derivation of indefinite integral formula for functions in the form of $(ax+b)^n$, where a and b are constants, n is an integer and $n \neq -1$:

Jika diberi fungsi $y = \int (ax+b)^n dx$, maka $\frac{dy}{dx} = (ax+b)^n$.

If given function $y = \int (ax+b)^n dx$, then $\frac{dy}{dx} = (ax+b)^n$

Imbas Kembali

Bagi suatu fungsi
 $y = g(u)$ dan $u = h(x)$,

$$\frac{dy}{dx} = \frac{dy}{du} \times \frac{du}{dx}$$

Katakan, $u = ax + b$

Jadi, $\frac{du}{dx} = a$

dan $\frac{dy}{du} = u^n$

Dengan menggunakan petua rantai,

$$\begin{aligned}\frac{dy}{du} &= \frac{dy}{dx} \times \frac{dx}{du} \\ &= \frac{dy}{dx} \times \frac{1}{\left(\frac{du}{dx}\right)}\end{aligned}$$

Gantikan $\frac{dy}{dx} = u^n$ dan $\frac{du}{dx} = a$, kita peroleh

$$\frac{dy}{du} = u^n \times \frac{1}{a}$$

$$y = \int \frac{u^n}{a} du$$

$$\int (ax + b)^n dx = \int \frac{u^n}{a} du$$

$$= \frac{1}{a} \int u^n du$$

$$= \frac{1}{a} \left[\frac{u^{n+1}}{n+1} \right] + c$$

Gantikan $u = ax + b$, kita peroleh

$$\int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + c$$

$\int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + c$, dengan keadaan
 a dan b ialah pemalar, n ialah integer dan $n \neq -1$.

Recall

For a function $y = g(u)$
and $u = h(x)$,

$$\frac{dy}{dx} = \frac{dy}{du} \times \frac{du}{dx}$$

Let $u = ax + b$

Then, $\frac{du}{dx} = a$

and $\frac{dy}{du} = u^n$

With chain rule,

$$\begin{aligned}\frac{dy}{du} &= \frac{dy}{dx} \times \frac{dx}{du} \\ &= \frac{dy}{dx} \times \frac{1}{\left(\frac{du}{dx}\right)}\end{aligned}$$

Substitute $\frac{dy}{dx} = u^n$ and $\frac{du}{dx} = a$, and we get

$$\frac{dy}{du} = u^n \times \frac{1}{a}$$

$$y = \int \frac{u^n}{a} du$$

$$\int (ax + b)^n dx = \int \frac{u^n}{a} du$$

$$= \frac{1}{a} \int u^n du$$

$$= \frac{1}{a} \left[\frac{u^{n+1}}{n+1} \right] + c$$

Substitute $u = ax + b$, and we get

$$\int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + c$$

$\int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + c$, where a and b
are constants, n is an integer and $n \neq -1$.

(b) Katakan $u = 5x + 2$

Jadi, $\frac{du}{dx} = 5$

$$dx = \frac{du}{5}$$

$$\begin{aligned}\int \sqrt{5x + 2} \, dx &= \int \frac{\sqrt{u}}{5} \, du \\ &= \int \frac{u^{\frac{1}{2}}}{5} \, du \\ &= \frac{2}{15} u^{\frac{3}{2}} + c \\ &= \frac{2}{15} (5x + 2)^{\frac{3}{2}} + c\end{aligned}$$

3.2.4 Persamaan lengkung daripada fungsi kecerunan Equation of a curve from its gradient function

NOTA / NOTE :

1.

Diberi suatu fungsi kecerunan $\frac{dy}{dx} = f'(x)$, maka persamaan lengkung bagi fungsi itu ialah $y = \int f'(x) dx$.

Given the gradient function $\frac{dy}{dx} = f'(x)$, the equation of curve for that function is $y = \int f'(x) dx$.

2. Nilai pemalar pengamiran, c boleh ditentukan dengan menggantikan nilai x dan y yang sepadan ke dalam hasil pengamiran suatu fungsi kecerunan.

The constant of integration, c can be determined by substituting the given value of x with its corresponding value of y into the result of integration of the gradient function.

Contoh 8 :

Contoh 8

Tentukan nilai pemalar pengamiran, c bagi $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$ dengan $y = 25$ apabila $x = 2$.

Penyelesaian

Diberi $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$.

Jadi, $y = \int (4x^3 + 6x^2 - 3) dx$

$$y = \frac{4x^4}{4} + \frac{6x^3}{3} - 3x + c$$

$$y = x^4 + 2x^3 - 3x + c$$

Apabila $x = 2$ dan $y = 25$,

$$25 = 2^4 + 2(2)^3 - 3(2) + c$$

$$c = -1$$

Maka, nilai pemalar pengamiran, c bagi $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$ ialah -1 .

Example 8 :

Example 8

Determine the constant of integration, c for $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$ where $y = 25$ when $x = 2$.

Solution

Given $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$.

Then, $y = \int (4x^3 + 6x^2 - 3) dx$

$$y = \frac{4x^4}{4} + \frac{6x^3}{3} - 3x + c$$

$$y = x^4 + 2x^3 - 3x + c$$

When $x = 2$ and $y = 25$,

$$25 = 2^4 + 2(2)^3 - 3(2) + c$$

$$c = -1$$

Thus, the constant of integration, c for $\frac{dy}{dx} = 4x^3 + 6x^2 - 3$ is -1 .

Contoh 9 :**Contoh 9**

Kecerunan bagi suatu lengkung pada titik (x, y) ialah $\frac{dy}{dx} = 15x^2 + 4x - 3$.

- Jika lengkung itu melalui titik $(-1, 2)$, cari persamaan lengkung itu.
- Seterusnya, cari nilai y apabila $x = 1$.

Penyelesaian

(a) Diberi $\frac{dy}{dx} = 15x^2 + 4x - 3$.

Jadi, $y = \int (15x^2 + 4x - 3) dx$
 $y = 5x^3 + 2x^2 - 3x + c$

Apabila $x = -1$ dan $y = 2$,
 $2 = 5(-1)^3 + 2(-1)^2 - 3(-1) + c$
 $c = 2$

Maka, persamaan lengkung itu ialah
 $y = 5x^3 + 2x^2 - 3x + 2$.

(b) Apabila $x = 1$,
 $y = 5(1)^3 + 2(1)^2 - 3(1) + 2$
 $y = 6$

Maka, $y = 6$ apabila $x = 1$.

Example 9 :**Example 9**

The gradient function of a curve at point (x, y) is given by $\frac{dy}{dx} = 15x^2 + 4x - 3$.

- If the curve passes through the point $(-1, 2)$, find the equation of the curve.
- Subsequently, find the value of y when $x = 1$.

Solution

(a) Given $\frac{dy}{dx} = 15x^2 + 4x - 3$.

Then, $y = \int (15x^2 + 4x - 3) dx$
 $y = 5x^3 + 2x^2 - 3x + c$

When $x = -1$ and $y = 2$,
 $2 = 5(-1)^3 + 2(-1)^2 - 3(-1) + c$
 $c = 2$

Thus, the equation of the curve is
 $y = 5x^3 + 2x^2 - 3x + 2$.

(b) When $x = 1$,

$y = 5(1)^3 + 2(1)^2 - 3(1) + 2$
 $y = 6$

Then, $y = 6$ when $x = 1$.
